CD SERIES CONVERTERS FOR DRIVING FLUORESCENT DISPLAY PANELS

Various fluorescent display panels are made by NEC Corporation, Ise Electronics Corporation (distributed by Noritake Co., Ltd.) and Futaba Corporation. The drive voltage, power consumption and drive system all differ according to the type of fluorescent display panel and since a multiple output power supply is required for the filament, anode, grid and cathode bias, the supply of a voltage from a converter can be said to display the greatest convenience.

TEMPERATURE AND HUMIDITY RANGES

Operating temperature range	0 to +50°C [32 to 122°F]
Storage temperature range	-20 to +80°C [-4 to +176°F]
Humidity	90%RH max. (Maximum wet-bulb temperature: 38°C [100.4°F])

CONNECTIONS AND DRIVE CIRCUITS

A. Negative voltage output type

Connections

- Ef (filament voltage) A center tap (CT) is provided. Floating (insulated) A.C. r.m.s. output.
- V₁ (Eb, Ec): D.C. negative voltage output; anode, grid supply voltage.
- V₂ (Ebb, Ecc): D.C. negative voltage output; voltage for obtaining cathode bias voltage (Ek); Ek=(Ebb, Ecc) - (Eb, Ec); no output is provided with a display panel which does not require Ek.
- C₁, C₂, C₃: External smoothing capacitors; dielectric strength and capacitance are shown when samples are supplied.

Drive circuit-1

- When the anode and grid potential is ground potential, standard converters are designed to use with this drive circuit-1.

Drive circuit-2

- When the anode and grid potential is +5V (TTL level), standard converters cannot be used with this drive circuit-2.

If a converter is required for this drive circuit, specify "bias drive."

B. Positive voltage output type

Connections

- Ef (filament voltage): A center tap (CT) is provided. Floating (insulated) A.C. r.m.s. output.
- V₁ (Ebb, Ecc): D.C. positive output voltage; anode and grid supply voltage inclusive of cathode bias voltage (Ek).
- C₁, C₂: External smoothing capacitors; dielectric strength and capacitance are shown when samples are supplied.
- Dz, R: Dz and R are connected to obtain the cathode bias voltage (Ek) and for the zener voltage (V_Z), select 0.5 to 1.0V above the Ek voltage of display panel. Set the zener current (I_Z) by R from 1 to 2 mA. However, with display panels which do not require Ek, Dz and R are not necessary, and the V₁ output voltage is the supply voltage of only the anode and grid.
- Set the Ek voltage for a dot type panel to the grid elimination voltage (Ecco) plus 2 to 3V. When Ek is not required Dz and R are not necessary and the V₁ output voltage becomes the supply voltage for the anode and grid only.

* Input voltage (V_{in}): +5 Vdc ± 10%

* Filament voltage is set to nominal value at V_{in} of +5.0V

* Correspondence with display panel specification table

N type-V₁: Voltage applied to grid and anode

V₂: Sum of voltage applied to grid, anode and cutoff voltage

P type-V₁: Sum of voltage applied to grid, anode and cutoff voltage

* Refer to page 175.

SHAPES AND DIMENSIONS

T-57-29

C-1

Output: 0.4W (400mW) max.
Weight: 4g

C-2

All dimensions are same as C-1, except (H*) changes to 10mm [.394 inches] max.

Output: 0.8W (800mW) max.
Weight: 6g

C-3

Output: 1.5W max.
Weight: 8g

C-4

All dimensions are same as C-3, except (H*) changes to 18mm [.709 inches] max.

Output: 3W max.
Weight: 16g

C-5

Output: 6W max.
Weight: 25g
