Keysight Technologies PNA and PNA-L Series Microwave Network Analyzers

The standard in microwave network analysis

PNA Family Sets the Standard for Microwave Network Analysis

Choose the leader

The PNA family builds on Keysight's 45-year legacy of excellence in network analysis to deliver new standards in performance, speed, accuracy, and versatility for microwave component test. The PNA family includes:

PNA-X Series – Keysight's most advanced and flexible network analyzer, providing complete linear and nonlinear component characterization in a single instrument with a single set of connections

PNA Series – the industry's highest performing network analyzer, offering many advanced measurement applications

PNA-L Series – designed for S-parameter and simple nonlinear testing of passive components, amplifiers, and frequency converters

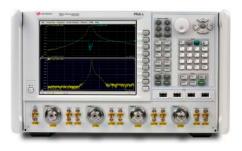

PNA-X Series Network Analyzers

N5249A 10 MHz to 8.5 GHz N5241A 10 MHz to 13.5 GHz N5242A 10 MHz to 26.5 GHz N5244A 10 MHz to 43.5 GHz N5245A 10 MHz to 50 GHz N5247A 10 MHz to 67 GHz

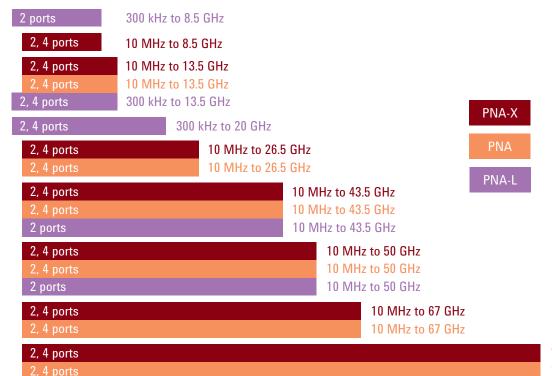

PNA Series Network Analyzers

N5221A 10 MHz to 13.5 GHz N5222A 10 MHz to 26.5 GHz N5224A 10 MHz to 43.5 GHz N5225A 10 MHz to 50 GHz N5227A 10 MHz to 67 GHz

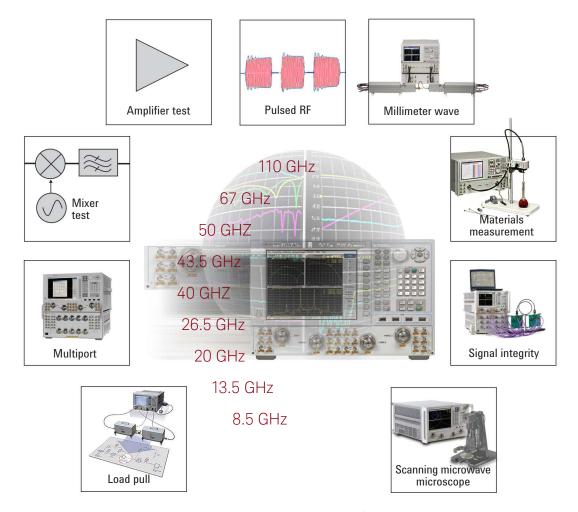

PNA-L Series Network Analyzers

N5239A 300 kHz to 8.5 GHz N5231A 300 kHz to 13.5 GHz N5232A 300 kHz to 20 GHz N5234A 10 MHz to 43.5 GHz N5235A 10 MHz to 50 GHz

10 MHz to 1.05 THz 10 MHz to 1.05 THz

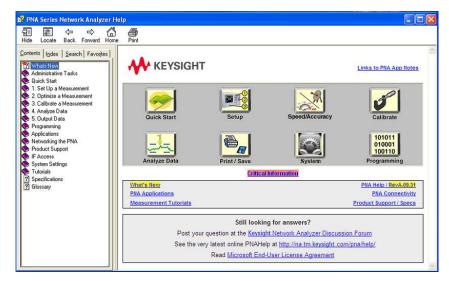

Complete Solutions for a Wide Range of Applications

In addition to being very capable standalone network analyzers, PNA and PNA-L instruments often form the core of more advanced measurement systems to serve a variety of microwave measurement applications.

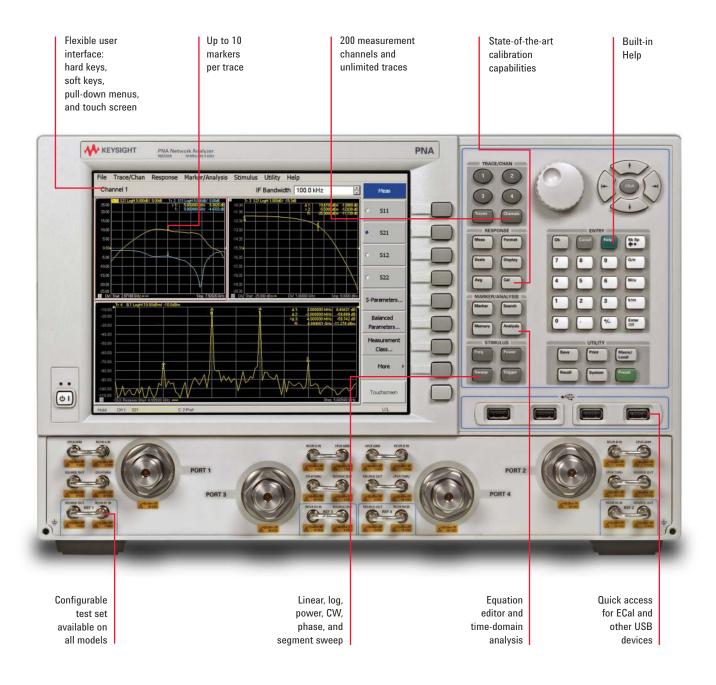

Future-proof your microwave component testing

All members of the PNA family share a common software platform that makes it easy to choose just the right level of performance to match your budget and measurement needs. This commonality guarantees measurement consistency and repeatability and a common remote-programming interface across multiple instruments in R&D and manufacturing. All of the powerful PNA software options can be added later to meet future test requirements.

The PNA's built-in help system provides a complete user's guide, including measurement tutorials and programming documentation.

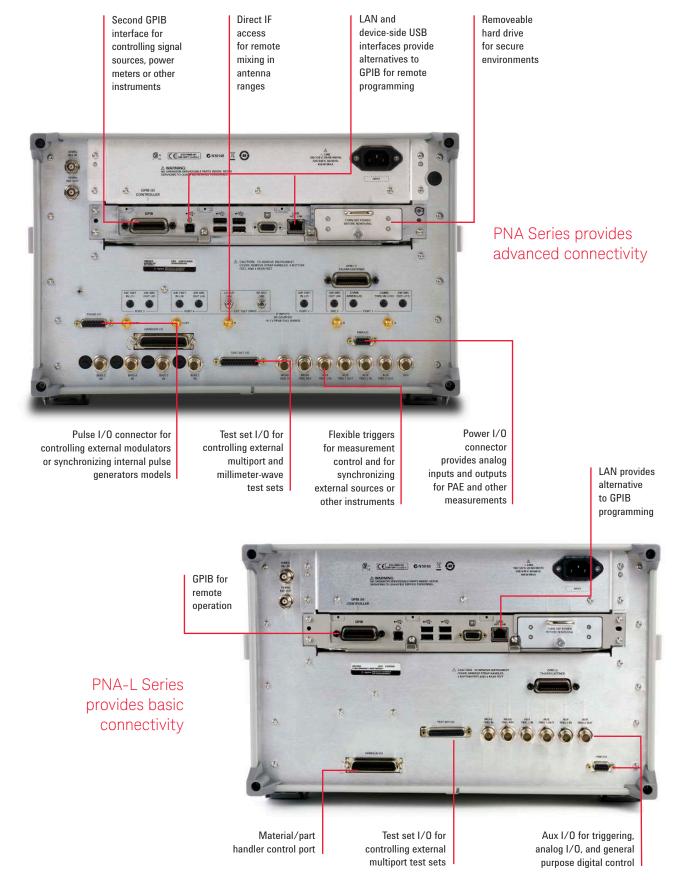

Innovative Features Across the PNA Family

All PNA models integrate a high resolution display with a touch screen, which provides a crisp view and easy access to all data and traces. This enhanced user interface allows intuitive operation and helps you set up complex measurements quickly.

Connectivity to Match Your Application

PNA Series

The PNA Series of network analyzers offers industry-leading performance for testing amplifiers, mixers and frequency converters. The PNA Series provides a winning combination of excellent hardware and powerful measurement applications to measure a broad range of devices fast and accurately. All models are available in 2-port single-source and 4-port dual-source versions. Pulsed S-parameters are easy using built-in pulse modulators and pulse generators.

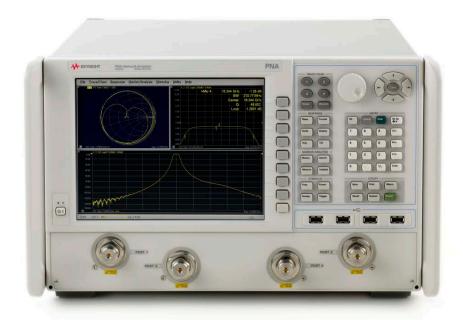

Highest performance

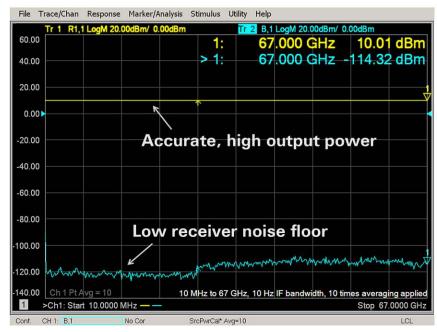

- High source output power of +13 dBm at 1 GHz to +11 dBm at 67 GHz
- High dynamic range: 127 dB at 20 GHz at test port
- Low trace noise: 0.002 dB rms at 1 kHz bandwidth
- Low receiver noise floor
- High receiver compression level
- Fast measurement speed:
 3.6 to 23 µsec/point
- High stability: < 0.03 dB/°C

Advanced applications

Many of the measurement applications developed for the PNA-X are now available for the PNA, such as:

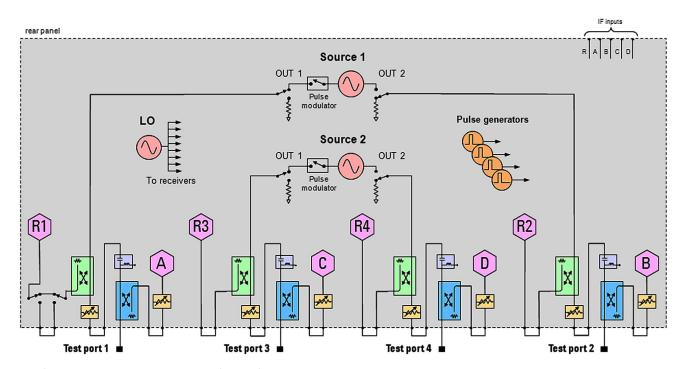

- Pulsed-RF (Option 008)
- Gain compression (Option 086)
- Intermodulation distortion (Option 087)
- Noise figure using standard receivers (Option 028)
- Source-phase control (Option 088)
- Differential and I/Q Devices (Option 089)
- True-mode stimulus (Option 460)
- Frequency converters (Options 082, 083)
- Embedded-LO (Option 084)
- Automatic fixture removal (Option 007)

With receiver-leveled output power of +10 dBm and a receiver noise floor of –114 dBm, the PNA typically has 124 dB of dynamic range at 67 GHz, more than any other network analyzer in this frequency range.

PNA Series

PNA Series block diagram shown with test set Option 419, plus pulse and external-IF options.

Performance	Legacy PNA E836x	New PNA N522x
Port power, 20 GHz	+3 dBm	+13 dBm
System dynamic range, 20 GHz	123 dB	127 dB
Receiver compression, 0.1 dB	–5 dBm	+12 dB
Source power sweep range	27 dB	38 dB
Minimum pulse width, wideband detection	50 us	100 ns

The new PNA Series network analyzers offer significantly better performance compared to legacy models.

Choose the Right Hardware for Your Test Needs

	Legacy PNA-L N5230C/ PNA-L N523xA	Legacy PNA E836x	PNA N522xA	PNA-X N524xA

More information about the PNA-X can be found online at www.keysight.com/find/pna-x or in the PNA-X Series brochure, 5990-4592EN

Simple, fast, and accurate pulsed-RF measurements (Options 008, 021, 022, 025)

Pulsed-RF measurement challenges

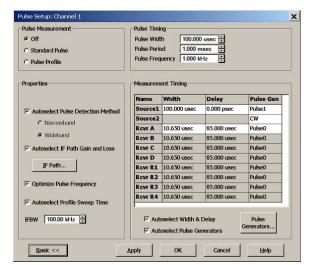

- Pulse generators and modulators required for pulsed-RF measurements add complexity in test setups
- For narrow pulses:
 - Maximum IF bandwidth of analyzer is often too small for wideband detection
 - Narrowband detection is slow, and measurements are noisy for low duty cycle pulses

PNA pulsed-RF measurements provide:

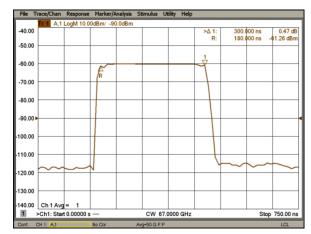

- A simple user interface for full control of two internal pulse modulators (Option 021 and 022), and four internal independent pulse generators (Option 025)
- Point-in-pulse measurements with 20 ns minimum pulse width, and pulse profile measurements with 10 ns minimum resolution (Option 008)
- Improved measurement speed and accuracy for narrowband detection using hardware filters and patented spectral-nulling and software IF-gating techniques
- Measurements using wideband detection with pulse widths as narrow as 100 ns
- Receiver leveling for accurate source-power control
- Pulse I/O connector on rear panel for synchronization with external equipment and DUT
- Accurate active-component characterization using unique application measurement classes for gain compression, swept-frequency/ power IMD, and noise figure

The PNA is a one-box pulsed-RF test solution that is simple to use and provides fast, accurate pulsed-RF characterization.

The pulsed-RF measurement application automatically optimizes the internal hardware configuration for specified pulse conditions to dramatically simplify test setups. Alternately, users can choose to manually set up the hardware for unique test requirements.

Pulse profile measurement using narrowband detection method allows 300 ns sweep time with 30 data points.

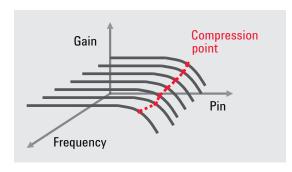

Fast, accurate gain compression versus frequency measurements of amplifiers and converters (Option 086)

Gain compression measurement challenges

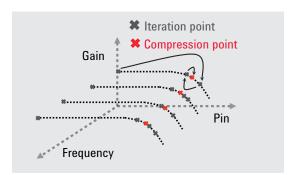

- Characterizing amplifier or frequency converter compression over its operating frequency range requires measurements at many frequency and power points, so setting up the measurements, calibration, and data manipulation takes a lot of time and effort
- A variety of errors degrade measurement accuracy, such as mismatch between the test port and the power sensor and DUT during absolute power measurements, and using linear S-parameter error correction in nonlinear compression measurements

PNA gain compression application (GCA) provides:

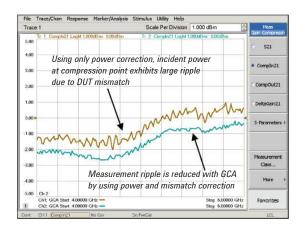

- Fast and convenient measurements with SMART Sweep, which greatly reduces the number of power points required to fully characterize compression versus frequency
- Highly accurate results using a guided calibration that provides power and mismatch correction
- Complete device characterization with two-dimensional (2D) sweeps, with the choice of sweeping power per frequency, or frequency per power
- Flexibility with a variety of compression methods compression from linear gain, maximum gain, X/Y compression, compression from back-off, or compression from saturation

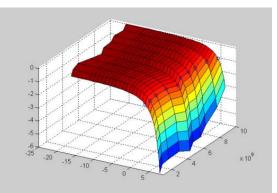

A network analyzer is commonly used for gain compression measurements by performing power sweeps at multiple CW frequencies. The PNA's GCA makes it easy to characterize compression over the DUT's operating frequency range with extreme speed and accuracy, and a simple setup.

Instead of a linear power sweep with many points, GCA's SMART Sweep uses an adaptive algorithm to find the desired compression point at each frequency with just a few power measurements, thus significantly reducing test times.

Complete device response to 2D sweeps—gain versus frequency and power—can be extracted for device modeling.

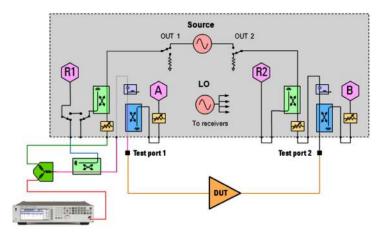

Fast two-tone intermodulation distortion (IMD) measurements with simple setup (Option 087)

IMD measurement challenges

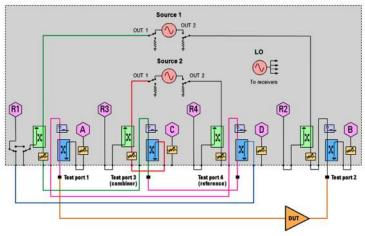

- Two signal generators, a spectrum analyzer, and an external combiner are most commonly used, requiring manual setup of all instruments and accessories
- Test times are slow when sweptfrequency or swept-power IMD is measured
- Instruments and test setups often cause significant measurement errors due to source-generated harmonics, cross-modulation, and phase noise, plus receiver compression and noise floor

PNA IMD application provides:

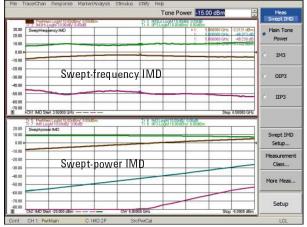

- Fast swept-IMD measurements of amplifiers and frequency converters
- Quick and easy measurements with an intuitive user interface
- Guided calibration that simplifies the calibration procedure and provides high measurement accuracy
- Spectrum analyzer mode for troubleshooting or making spurious measurements, eliminating the need for a separate spectrum analyzer

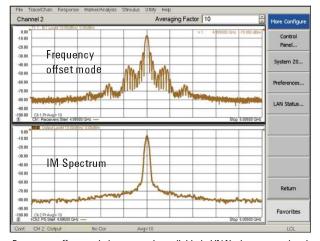

A 2-port PNA can be used with an external signal source, combiner and coupler for IMD measurements.

On a 4-port PNA, the two internal sources can be used to create the IMD stimulus. Unused test port couplers can be used as a combiner and reference coupler.

IMD application measures third order IMD and IP3 at 201 frequency (or power) points in a matter of seconds, compared to several minutes using signal generators and a spectrum analyzer.

Frequency-offset mode is commonly available in VNA's, but conventional IF filter responses exhibit high side lobes. The IM Spectrum mode employs an optimized digital-IF filter along with software preselection, to provide true spectrum measurement capability in the PNA.

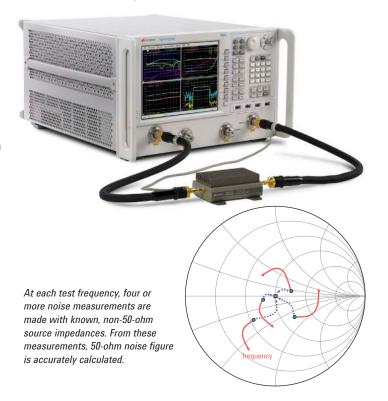

Fast and accurate noise figure measurements (Option 028)

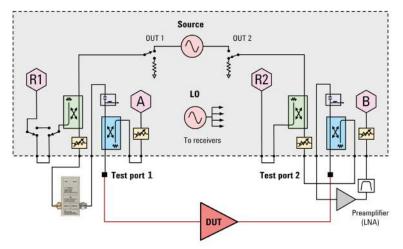

Noise figure measurement challenges with traditional, Y-factor approach

- Multiple instruments and multiple connections required to fully characterize DUT
- Measurement accuracy degrades in fixtured, on-wafer, and automatedtest environments, where noise source cannot be connected directly to DUT
- Measurements are slow, often leading to fewer measured data points and misleading results due to under-sampling

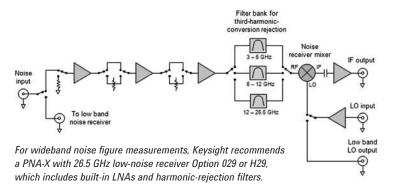

PNA noise figure solution provides:

- Amplifier and frequency converter measurements with the highest accuracy in the industry, using advanced error-correction methods
- Correction for imperfect system source match by using vector correction to remove mismatch errors plus an ECal module used as an impedance tuner to remove noise-parameter-induced errors
- High measurement accuracy in fixtured, on-wafer, or automatedtest environments
- Fast measurements: typically 4 to 10 times faster than Keysight's NFA Series noise figure analyzers
- Accurate measurements of differential devices using vector deembedding of baluns or hybrids

PNA noise figure measurement setup using an ECal module as an impedance tuner, and an external LNA and filter for improved sensitivity and measurement accuracy.

Fast, high-gamma active-load amplifier characterization (Option 088)

Load-charaterization measurement challenges

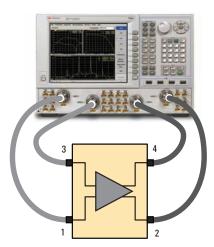

- Handling high-power DUTs
- Mechanical tuners cannot supply fully reflective loads and are slow

PNA source-phase control application provides:

- Fast active-loads using built-in second source or an external source
- Full reflection with user-defined fixed or swept phase angles
- Measurements of amplifier output power, match, and gain under different load conditions
- Hybrid setups that combine mechanical and active tuning for fundamental and harmonic load pull

In a hybrid load-pull setup, the passive tuner provides the majority of the reflected signal, so the power required of the active load for full reflection is much lower.

Using the PNA's two internal sources, iTMSA drives the differential amplifier under real world conditions, providing accurate mixed-mode S-parameters in all operating environments.

Simplified test of I/Q converters and modulators, and differential mixers (Option 089)

I/Q and differential converter measurement challenges

- Requires signals with 90° or 180° phase difference
- Traditional approach uses hybrid couplers and/or baluns which are:
 - Inherently band-limited, requiring multiple components for broadband measurements
 - Limited to fixed phase offsets, preventing phase sweeps to determine optimum alignment
 - Lossy and inaccurate (± 3° to 12° typically)
 - Difficult to use with on-wafer setups

PNA-X differential and I/Q devices application

- Provides accurate phase control of internal and external sources, eliminating the need for hybrid couplers and baluns
- Tunes receivers to all user-specified output frequencies needed to fully characterize the DUT
- Sweeps frequency to measure operating bandwidth or sweeps phase and power at a fixed frequency to measure quadrature or differential imbalance
- Includes match-corrected power measurements for highest accuracy

Testing differential amplifiers under real operating conditions (Option 460)

Differential amplifier measurement challenges

- Conventional two-port VNAs with baluns do not provide commonmode and mixed-mode responses
- Baluns are inherently band-limited devices, which forces multiple test setups for broad frequency coverage
- Phase errors of baluns provide inaccurate differential responses
- Modern four-port VNAs provide mixed-mode S-parameter measurements with single-ended stimulus, but differential amplifiers may respond differently when in compression during real operating environments

PNA integrated true-mode stimulus application (iTMSA) provides:

- Mixed-mode S-parameters of differential amplifiers driven by true differential and common-mode signals
- Mismatch correction at the DUT input to minimize phase and amplitude errors between the two sources
- Input-only drive mode that prevents damage to amplifiers caused by stimulus on the output port
- In-fixture arbitrary phase offset and phase-offset sweeps to optimize input matching network for maximum amplifier gain

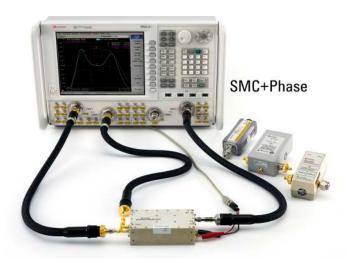

Accurate characterization of mixers and converters (Options 082, 083)

Mixer and converter measurement challenges

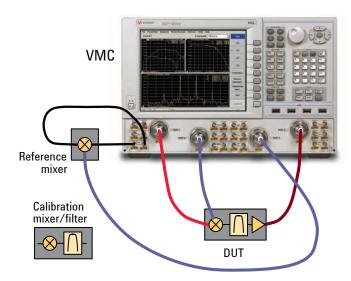

- Traditional approach with spectrum analyzer and external signal sources is cumbersome, slow, and does not provide phase or group delay information
- Conventional VNAs require an external signal source, which degrades sweep speed
- Conventional VNAs provide phase or group delay data relative to a "golden" device
- Attenuators are often used to minimize ripple due to input and output mismatch, at the expense of dynamic range and calibration stability

PNA frequency converter applications provide:

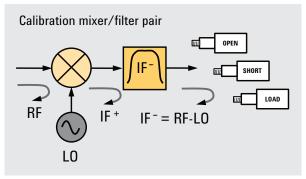

- Simple setup using internal second signal source as a local oscillator (LO) signal
- Typical measurement time improvement of 100x compared to spectrum analyzer-based approach
- High measurement accuracy using two patented techniques:
 - Scalar mixer/converter (SMC)
 provides match and most accurate
 conversion loss/gain measure ments by combining two-port
 and power-meter calibrations
 (Option 082), and with Option 083,
 calibrated absolute group delay
 measurements without a
 reference or calibration mixer
 - Vector mixer/converter (VMC)
 provides measurements of match,
 conversion loss/gain, delay, phase
 difference between multiple paths
 or devices, and phase shifts within
 a device, using a vector-calibrated
 through mixer (Option 083)
- Input and output mismatch correction reduces ripple and eliminates the need for attenuators

Option 083's Scalar Mixer/Converter plus Phase (SMC+Phase) makes mixer and converter measurements simple to set up since reference and calibration mixers are not required. Calibration is easy to perform using three broadband standards: a power meter as a magnitude standard, a comb generator as a phase standard, and an S-parameter calibration kit (mechanical or ECal module).

The vector mixer/converter technique provides measurements of match, conversion loss/gain, delay, phase difference between multiple paths or devices, and phase shifts within a device.

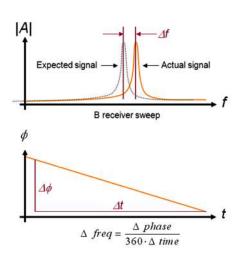

Keysight's frequency converter application vector-mixer-characterization method uses open, short, and load standards and reflection measurements to create a characterized, frequency-translating through standard.

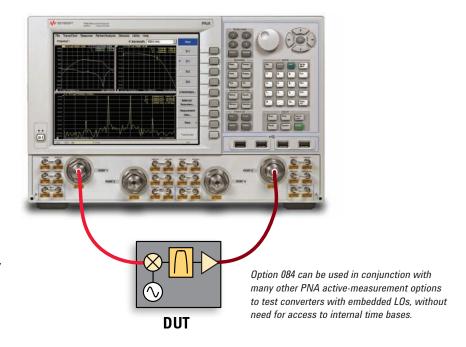

Measuring Converters with Embedded LOs (Option 084)

Embedded-LO Option 084

- Uses coarse- and fine-tuning sweeps to calculate LO deviation from nominal value
- Automatically tunes the PNA receivers to correct for DUT LO drift, sweep by sweep
- Works with:
 - Noise figure application, Options 028/029
 - Scalar mixer/converter Application, Option 082
 - Frequency converter application, Option 083
 - Gain compression application, Option 086
 - Intermodulation distortion application, Option 087

Option 084 uses a coarse frequency sweep (top) to determine the nominal LO offset. A phase-versus-time sweep (bottom) is used to fine-tune the estimate of LO offset.

Comparing converter measurements with a locked and unlocked LO shows excellent measurement correlation. Averaging and modest amounts of smoothing are often used to increase accuracy and precision when measuring devices with embedded LOs.

Extending the PNA to millimeter-wave frequencies

PNA's unique hardware architecture provides:

- Two- and four-port solutions for measurements on a wide variety of single-ended and balanced millimeter-wave devices
- True-mode differential measurements at millimeter-wave frequencies using two internal sources
- Fully integrated solution for millimeter-wave pulse measurements using built-in pulse modulators, pulse generators, and receiver gates
- Accurate leveled power at millimeter-wave frequencies with advanced source-power calibration methods
- Direct connection of terahertz modules driven by a 50 GHz PNA
- Single-sweep network analysis from 10 MHz to 110 GHz with full powerlevel control, using the 67 GHz PNA and millimeter-wave extension modules

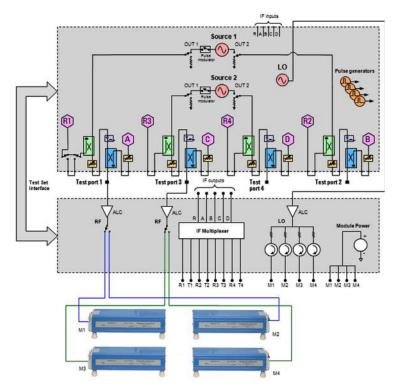

Two- and four-port broadband, singlesweep solutions (10 MHz to 110 GHz)

PNA-based 110 GHz systems come in two- and four-port versions, with power-level control, true-differential stimulus, and the ability to measure frequency converters with SMC. These systems are table-top replacements for 8510XF systems, with superior performance.

Terahertz solutions without a test set

Direct connection of VDI modules to a 50 GHz PNA enables S-parameter measurements to 1.05 THz.

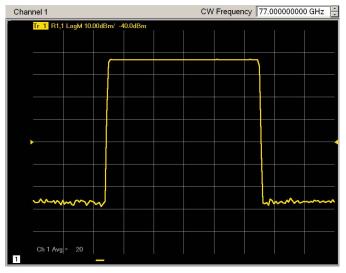

Four-port system architecture

Block diagram of a 4-port millimeter-wave system with coherent source control of OML modules using the N5262A millimeter-wave test-set controller.

PNA Series Innovative Applications Millimeter-wave applications with the PNA

Integrated pulse measurements

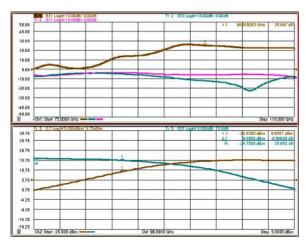

The PNA's internal pulse modulators create pulsed-RF signals for the millimeter-wave modules, making it easy to set up and perform pulsed millimeter-wave measurements.

Pulse profile at 77 GHz using the internal pulsed source and IF gates of the PNA.

Gain compression

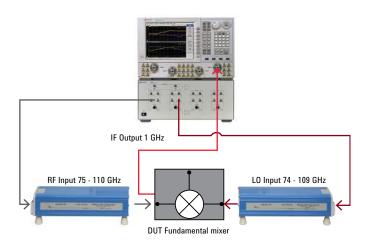

Using calibrated source-power sweeps, the PNA provides the most accurate millimeter-wave gain-compression measurements in the industry.

Example gain compression measurement of a 75 to 110 GHz packaged PHEMT transistor amplifier.

Scalar mixer measurements

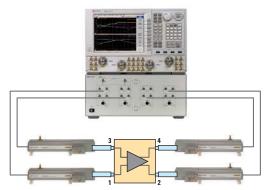

A two-module system can be used to provide fundamental RF and LO signals to a millimeter-wave mixer for conversion loss measurements.

Two-module system for measuring millimeter-wave mixers and converters.

True-mode differential measurements at millimeter-wave frequencies

- Highest measurement accuracy in the industry using advanced error-correction methods
- Integrated phase sweeps with power control

True differential measurement of a balanced LNA using a PNA-X, the N5262A millimeter-wave test-set controller, and four millimeter-wave test modules.

PNA-L: Passive and Active Device Test at Affordable Prices

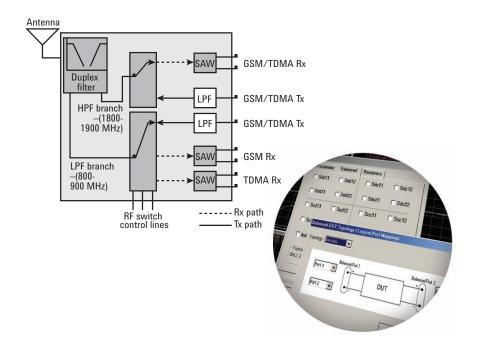

The Keysight PNA-L is designed for your general-purpose network analysis needs and priced for your budget. With the same core firmware as the PNA, the PNA-L offers the perfect balance of value and performance. The PNA-L provides efficiency and flexibility in both manufacturing and R&D applications, for industries ranging from mobile-telecomm and wireless-LAN component production to aerospace and defense.

Balanced/differential components

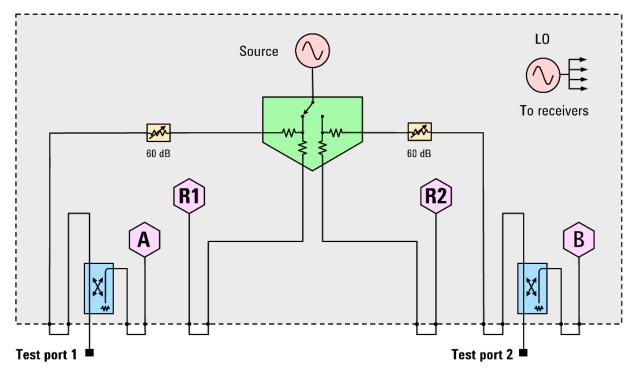

For passive devices that have one or more balanced/differential ports, the PNA-L is an excellent choice for mixed-mode S-parameter measurements, without the need or limitations of using baluns.

- Display differential-, common-, and mixed-mode performance, in a variety of trace formats
- Measurement parameters include common-mode-rejection ratio and amplitude and phase imbalance
- Supported port configurations include single-ended-to-balanced and balanced-to-balanced topologies

PNA-L Series:

The Economical Choice for Signal Integrity and Material Measurements

Physical Layer Test Software (PLTS)

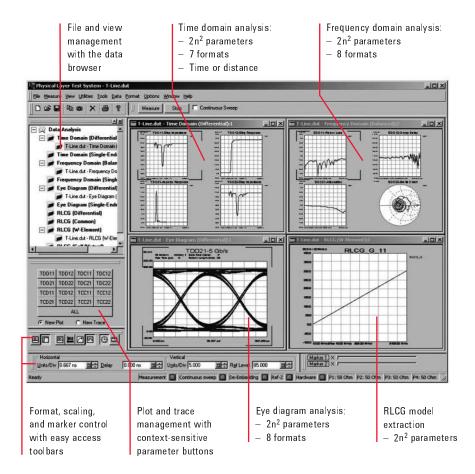

The Keysight PNA-L is the ideal microwave engine to power PLTS software.

PLTS provides:

- Forward and reverse reflection and transmission measurements, with time- and frequency-domain displays targeted specifically for signal-integrity analysis
- Guided setup, calibration, and data acquisition
- Full modal analysis including single-ended, differential, and cross-mode conversions
- A powerful, virtual bit-pattern generator to create eye diagrams based on measured channel data
- Highly accurate RLCG models to enhance the accuracy of your models and simulations
- Automatic fixture removal for symmetric and asymmetric fixtures
- Advanced formula editor for userdefined equations such as power sums for crosstalk-compliance measurements

Materials measurements

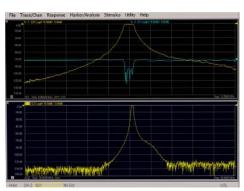

Keysight offers several tools to help determine the intrinsic electromagnetic properties of materials, including 85071E materials measurement software, 85070E dielectric probe kit, and 85072A split cylinder resonator. The complete system is based on a versatile Keysight network analyzer like the PNA-L, which measures the material's response to RF or microwave energy.

PLTS provides a wealth of analysis tools for signal-integrity engineers.

Keysight material measurements solutions provide:

- Control of the network analyzer to automate complex permittivity and permeability measurements versus frequency
- Display of results in a variety of formats (ε_r', ε_r", tan δ, μ_r', μ_r", tan δ_m and Cole-Cole)
- A variety of measurement methods and mathematical models to meet most application needs
- Support for many different probes and fixtures, as well as free-space measurements
- Data easily shared with other Windows-based programs or through the component object model (COM) interface

On-Wafer Measurements with the PNA Family

PNA and PNA-L network analyzers can easily be integrated with a microwave probe station to form a complete on-wafer measurement system. All of the PNA's powerful measurement applications can be used for on-wafer devices. When calibration requires a power sensor, the PNA firmware guides the user through the steps required to align power and S-parameter calibration planes into a single set of on-wafer reference planes.

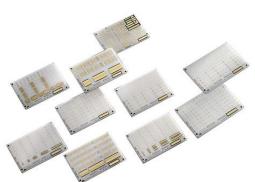

PNA-based on-wafer solutions provide:

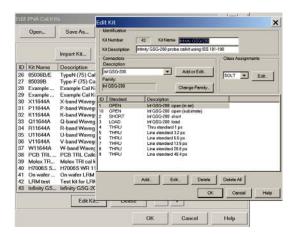

- Measurements on filters, amplifiers, and frequency converters
- Complete set of TRL-class calibrations for accurate measurements
- Differential measurement capability using single-ended or true-mode stimulus
- Accurate power-level control for precise power measurements
- Probe-characterization macro to easily measure S-parameters of probes for deembedding

Complete wafer-probe solutions from Cascade Microtech

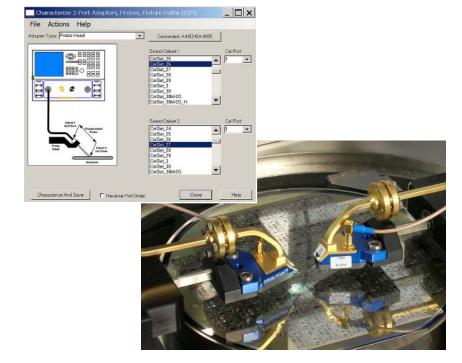

Cascade Microtech is the worldwide leader for high-quality microwave probing systems and is an official Keysight Solutions Partner. Cascade offers a broad variety of test stations and probes to cover any application and frequency range. In addition, WinCal XE software enhances RF measurement accuracy and productivity through guided system setup, automatic calibration and validation, test sequencing, and other advanced RF measurement tools.

The PNA cal kit editor makes it easy to enter impedencesubstrate standard (ISS) definitions for on-wafer calibration

Extend the Power of the PNA Family to Multiport Devices

Multiport test challenges:

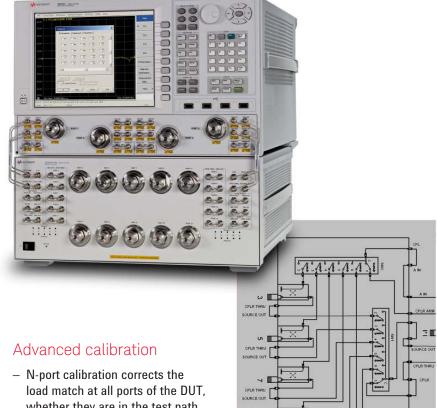

- Many components have more than 4 ports
- Moving test cables is slow and prone to errors
- Standard two-port calibration doesn't correct for ports outside the test path, resulting in degraded accuracy

PNA and PNA-L multiport solutions provide:

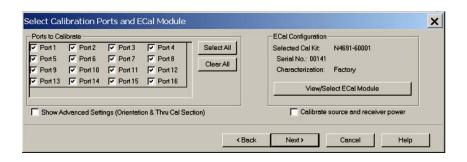

- Integrated test systems consisting of a network analyzer and an external multiport test set, seamlessly controlled by the PNA's firmware
- A single set of test connections to the DUT, resulting in high test throughput
- High accuracy with advanced calibration methods.
- Full compatibility with PLTS

Flexible test set hardware

- Test couplers on each port provide accurate and stable measurements
- External signal conditioning hardware such as attenuators, amplifiers, or isolators can be added as needed to handle a variety of device types
- Get full cross-bar switching to cover any DUT, or limit the test paths to match those required by a specific DUT

- N-port calibration corrects the load match at all ports of the DUT, whether they are in the test path or not. This gives a high level of accuracy, independent of the isolation between ports of the DUT.
- OSOLT (quick short, open, load, thru) calibration reduces the number of correction standards required for full N-port calibration
- Application-specific calibrations to support compression, IMD, and noise figure can be applied in conjunction with the test set

Completing the Solution

Advanced calibration tools

Calibrating network analyzers is critical for high accuracy measurements and can be particularly challenging in non-coaxial environments such as in-fixture, on-wafer, or waveguide. The PNA family supports a broad range of mechanical and electronic calibration kits, and offers advanced calibration methods to enhance ease-of-use while providing best-in-class accuracy. Keysight calibration tools include:

- High-performance two-and four-port ECal modules, covering 300 kHz to 67 GHz, with nine connector types
- QSOLT and n-port calibration for multiport test systems
- Data-based calibration-standard models and expanded math for enhanced accuracy at high frequencies
- Match-corrected power measurements to eliminate mismatch errors
- Software fixturing for deembedding, port matching, and impedance transformation

Protect your software investment

Keysight protects your 8753, 8720 and 8510 software investment by providing migration tools to reduce your code conversion effort.
