I use part number 305-056-520-201 from Digikey/Mouser etc for the card edge connector inside the TM500 mainframes.

I have one of the rectangular section extenders, but it doesn't get too much use. I made a long flexible years ago that gets most of the use. Not good for high speeds, but it doesn't really have to be.

There were extenders, rectangular cross section ridgid aluminum with the connectors on the ends, some 8 or 9 inches long. The part number(s) have been mentioned on the list a while ago.

I have a flexible cable but it looks very home- or shop-made.

I found this connector in Ebay. https://www.ebay.de/itm/143991611326. Very good quality. Pictured tin plated, but when it arrived it was gold plated. It was only 3.37 Euro incl. shipment from China, and it arrived within 2 weeks. I want to make an extender with flexible cable, using only the power supply wires.

These look also interesting.

What number of pins is needed for a 544 with 1A1?

Sorry, that's a completely different connector. Emissionlabs has mistaken the "500-series" subject line to mean "TM500 series". The former is oscilloscopes, the latter is a modular test instrument system.
