General Description

The GS7611 is a power switch controller used to provide 5VDUAL voltage for modern motherboards. It controls the switches to provide 5VDUAL. In active state, ATX/BTX 5VCC provides the output voltage through an NMOS transistor, in S3 sleep state, ATX/BTX 5VSB provides the output voltage through a PMOS transistor. In S4/S5 state, a MODE pin decides whether 5VDUAL is shut down or stays on. Soft start function is implemented to limit inrush current from 5VSB supply.
